

IN THE CLAIMS:

The following is a complete listing of the claims in this application, reflects all changes currently being made to the claims, and replaces all earlier versions and all earlier listings of the claims:

1.-22. (Canceled)

23. (Currently Amended) A data processing apparatus connectable to a LAN, comprising:

an input unit, adapted to input data;

a storage unit, adapted to store the data inputted by said input unit;

an identification unit, adapted to obtain user information about a user for whom the data inputted by said input unit was received;

a transfer unit, adapted to transfer the data inputted by said input unit to a terminal connected to the LAN through the LAN when it is impossible to store the data inputted by said input unit in said storage unit; and

a generation unit, adapted to generate a predetermined notification, based on the user information obtained by said identification unit, to notify the user that the data has been transferred by said transfer unit, the notification including information indicating the terminal to which the data is transferred by said transfer unit; and

a sending unit, adapted to send the predetermined notification generated by said generation unit to the user corresponding to the user information obtained by said identification unit as mail.

24. (Previously Presented) A data processing apparatus according to Claim 23, wherein said storage unit is adapted to store information used to discriminate to which terminal the data is transferred by said transfer unit.

25. (Previously Presented) A data processing apparatus according to Claim 23, wherein said transfer unit transfers the data inputted by said input unit when a printer for printing the data is in an error state.

26. (Currently Amended) A method of controlling a data processing apparatus connectable to a LAN, comprising the steps of:

inputting data;  
storing the data inputted in said inputting step in a storage unit;  
obtaining user information about a user for whom the data inputted in said inputting step was received;  
transferring the data inputted in said inputting step to a terminal connected to the LAN through the LAN when it is impossible to store the data in the storage unit;

[[and]]

generating a predetermined notification, based on the user information obtained in said obtaining step, to notify the user that the data has been transferred in said transferring step, the notification including information indicating the terminal to which the data is transferred in said transferring step; and

sending the predetermined notification generated in said generating step to the user corresponding to the user information obtained in said obtaining step as mail.

27. (Currently Amended) A computer-readable storage medium storing a program for implementing a method of controlling a data processing apparatus connectable to a LAN, wherein the method comprises the steps of:

inputting data;

storing the data inputted in said inputting step in a storage unit;

obtaining user information about a user for whom the data inputted in said inputting step was received;

transferring the data inputted in said inputting step to a terminal connected to the LAN through the LAN when it is impossible to store the data inputted in said inputting step in the storage unit; [[and]]

generating a predetermined notification, based on the user information obtained in said obtaining step, to notify the user that the data has been transferred in said transferring step, the notification including information indicating the terminal to which the data is transferred in said transferring step; and

sending the predetermined notification generated in said generating step to the user corresponding to the user information obtained in said obtaining step as mail.

28. (New) A data processing apparatus connected to a LAN, comprising:

a receiver, adapted to receive data through a communication line from a sender;

a storage unit, adapted to store the data received by said receiver;

a transfer unit, adapted to transfer the data stored in said storage unit to a terminal connected to the LAN through the LAN in a case where a predetermined condition is satisfied; and

a sending unit, adapted to send a report mail indicating that the data received by said receiver was transferred by said transfer unit.

29. (New) The apparatus according to claim 28, further comprising a printer adapted to print an image based on the data received by said receiver, wherein said transfer unit transfers the data in a case where said printer is in an error state.

30. (New) The apparatus according to claim 28, wherein said transfer unit transfers the data received by said receiver in a case where said storage unit is in a full state.

31. (New) The apparatus according to claim 28, wherein said transfer unit transfers the data in accordance with an internet protocol.

32. (New) The apparatus according to claim 31, wherein said transfer unit transfers the data in accordance with a TCP/IP protocol.

33. (New) The apparatus according to claim 28, wherein said transfer unit selects the data to be transferred in accordance with a priority.
